

Voice & Data Services

LightBound’s telephony solutions offer a rich and flexible feature set combining both classical PBX functionality and advanced features. A LightBound PBX system include features like Voice-mail, Conference Bridging and Call queuing one would expect in larger proprietary systems.

Traditional PBX Transformed

If you have ever implemented a business telephone system, you have probably uttered the words “painful”, “high-cost” and “proprietary”. It doesn’t have to be that way.

Why spend six figures on a vendor proprietary solution. Instead, imagine being able to get a much more flexible, extendable and standards-based system that performs all the same functions and more for up to 75% less.

LightBound Architecture

The LightBound PBX is standards-based and carefully designed for maximum flexibility. Specific APIs are defined around a central PBX core system. Using hardware and technology available now or in the future to perform its essential functions.

- **PBX Switching** - The Switching system connects calls together between various users and automated tasks.
- **Application Launcher** - performs services for uses, such as voicemail, file playback and directory listing.
- **Codec Translator** - A number of audio compression formats are available to suit diverse needs and arrive at the best balance between audio quality and bandwidth usage

Standard Features

LightBound’s PBX always includes these services at additional no charge:

- Automated Attendant
- Blind Transfer
- Call Forward Busy
- Call Forward No Answer
- Call Parking
- Call Transfer
